

# COVER STORY

# Take the safe course to web based maintenance

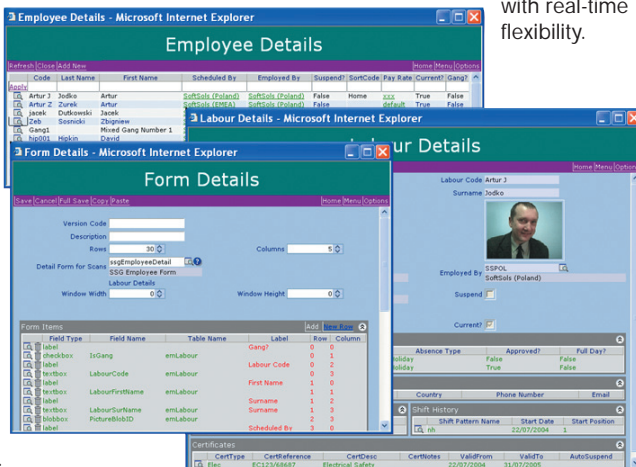

**SoftSols Group has announced the next generation of its internationally recognised IMPACTxp Maintenance and Enterprise Asset Management System**

**B**uilt using SoftSols Group's innovative FastNET ASP\* web technology, IMPACT.Net is a zero footprint web browser based solution that can literally be accessed from anywhere at anytime via the Internet. All that is required is a standard browser on a PC, laptop or PDA. There are no initial downloads – just login and start processing.

This pure simplicity of deployment means the system can be used by anyone in the organisation with a need to review or update work order, asset or maintenance related information. However, simplicity does not mean compromise in functionality or performance, far from it, as the underlying FastNET ASP technology provides unique features that mean screen layouts, reports and menu options can be configured for every user to meet their specific requirements – online.

No more waiting for the supplier to change the screen, no more waiting for the consultant to reconfigure the report – do it here and now. This unique facility makes IMPACT.Net accessible to all in the organisation in the format they require. New fields can even be added to the database as required without affecting the integrity of the system or the need for programming skills. Customised validation and data look up features can be attached to the new field providing the richest possible functionality for an Enterprise Asset Management System

with real-time flexibility.

The look and feel of the system is driven by style sheets allowing you to incorporate your company logo and use in-house design guidelines to seamlessly integrate IMPACT.NET with other corporate solutions.

Each user can be presented with their own live Key Performance Indicator charts (KPI's) as they log into the system bringing critical business intelligence to their attention and promoting rapid resolution of issues.

The user's own unique view of the system can be configured to make their tasks as simple as possible, with the ability to attach photographs, documents, images, drawings and videos to any record. The information they need is at hand in the format they need, when they need it. What's more, any reconfiguration of their view of the system can simply be done online as they need the change, without even logging out of their session.

IMPACT.Net can work with multiple databases including Microsoft SQL Server, Oracle and Progress. It uses Crystal Reports or Microsoft Reporting Services to provide online reporting and graphical analysis capabilities.

This is the new generation of Maintenance Management systems. You access it wherever you want, whenever you want, with the information you want, in the format you want. Why use a system that dictates how your information is displayed when you can implement IMPACT.Net, which lets you decide.

Contact SoftSols Group now for more details and take the safe course to effective maintenance with IMPACT.Net.

*\*FastNet ASP controls the complete user interface for a Microsoft .NET web based application allowing developers to focus entirely on the design of the database and application logic. Screen layout, customisation, translation for foreign languages, menu access, data validation and lookups can now be configured by non-programming staff in a robust template driven environment, driving up quality and dramatically reducing costs and time to market. Contact us at [fastnet@softsolsgroup.com](mailto:fastnet@softsolsgroup.com) to find out how FastNET ASP can be used for your own in-house development projects.*
